Does Perl 6 support array assignment like Python does? For example: my @names = qw/ first second third /; $names[1] = 'john'; say $names[1]; A: You don't have to specify the length of your array. my @names = qw/ first second third /; $names[2] = 'john'; say $names[1]; The syntax $names[2] = 'john' is actually a bit misleading. It's an OOP syntax (like Java or C#). The comma after the elements tells Perl to separate that list by commas: my $name1 = 'first'; my $name2 ='second'; my @names = qw/ $name1 $name2 /; Now the array has three elements. In the variable context ($names in this example), the elements are $name1, $name2 and the empty string. If you access the elements using the [] notation, they are the strings first, second and,. Note that the OOP style syntax with multiple arguments is only one of the available operators. The others are: $name1. $name2 -> interpolate $name1 + $name2 -> concatenate $name1.= $name2 -> prepend $name1. $name2 -> append You can use any of them inside a [] operator if you specify a length for 5b5f913d15
