Bzip2 is a file compression program which uses the Burrows-Wheeler block-sorting text compression algorithm, with default compression level 7 (3.1). Bzip2 is designed to be a drop-in replacement for gzip. Bzip2 aims to compress files to get better compression than gzip, but to have similar decompression speed, while producing smaller files than gzip. The main goal of Bzip2 is to create small files with good speed, while maintaining high compression ratios. See the Bzip2 Programmer's Manual for more information. An Introduction to the Bzip2 file format. Overview The main points of the bzip2 file format are summarised here. For more detailed information, see the bzip2 documentation in bzip2-1.0.6/docs/bzip2.txt. Bzip2 can be used to compress files using a "block" compression technique. In block compression, the program simply reads some amount of data from the file and then looks for similar pieces of data in a table called a "Block.txt". The first time that it finds a piece of data that is very similar to the data already read, it will rearrange the data in a new block. This produces blocks of smaller size than the original file. The main advantage of this technique is that it can be easily "decompressed" by simply reading a block at a time. The other advantages are that the program can handle files larger than 4GB, and can produce much smaller files than the gzip compression format. The second major advantage of bzip2 is that it can be use to compress several files together into one "compressed" file. The final file produced by this is somewhat similar to a Zip file, but is generally larger. This is very useful if you are uploading a file to an online site such as a website or an ftp server, or if you are mailing a file to someone. The program is not as efficient in this mode as gzip, but is often sufficient for most people. General Structure The files produced by the bzip2 program have a compressed format similar to the format of most other compression formats. However, they are usually larger than other formats. They are made up of sequences of numbers called "BLOCKs". Each BLOCK begins with a five-digit number called the "Block-ID". The Block-ID is a unique identifier for the particular BL

It is a simple GUI for the bzip2 compression and decompression program. It can decompress, and is able to read and write to archives created by bzip2. The GUI can display the progress of the compression and decompression process, and provides an easy way to view the content of the compressed files, archive names, date and time, etc. You can compare files (by compression ratio, name, size, etc.), copy and move files, and create archive from different files, either all at once or sequentially. How to install: Download Bzip2GUI (.exe) from: Bzip2GUI installation depends on the Windows OS used and on the Bit version. In all cases, the installation procedure is the same. 1) Extract and install Start the install procedure as administrator. The name of the items selected will be displayed on top of the selection area. A checkbox is displayed on the list allowing you to select which files have the.BZ2 or.bz2 file type extension. If you do not want to select all the items at once, you can also select all the items by clicking on the "Select All" button and then press the "Compress" button. This is an example of the list of files selected for compression, with the.bz2 extension filter enabled: Decompression (Enter) The process for decompression is similar to compression. Select the
