The Adenomatous polyposis coli (APC) tumor suppressor protein controls intestinal development and homeostasis by controlling the degradation of beta-catenin. In order to test whether APC is localized to adherens junctions of intestinal cells, we generated an APC monoclonal antibody. In immunohistochemical studies of normal human intestine, APC was expressed in the apical half of intestinal epithelia where cell-cell adherens junctions are present. This localization was confirmed by immunofluorescence, subcellular fractionation, and by biochemical analysis of the APC protein. In adenoma cells, in contrast, the APC protein was concentrated at cell-cell contacts. In human colon cancer cell lines APC and beta-catenin colocalized at adherens junctions. Association of APC and beta-catenin was independent of GSK3 activity, since in DLD-1 cells, where APC has been phosphorylated by GSK3, the two proteins colocalized. Moreover, APC and beta-catenin colocalized in a mouse intestinal cancer cell line derived from a transgenic mouse that carries a v-myc oncogene. These results suggest that APC and beta-catenin colocalize in normal and malignant intestinal epithelia and that beta-catenin-mediated transformation does not necessarily require its destruction by APC.
